THE BASICS OF TECHNICAL ANALYSIS

Data

let me show you

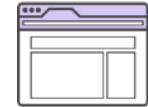

How?

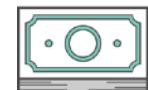

A Model!

Results!

Product!

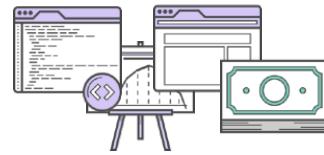

Revenue!

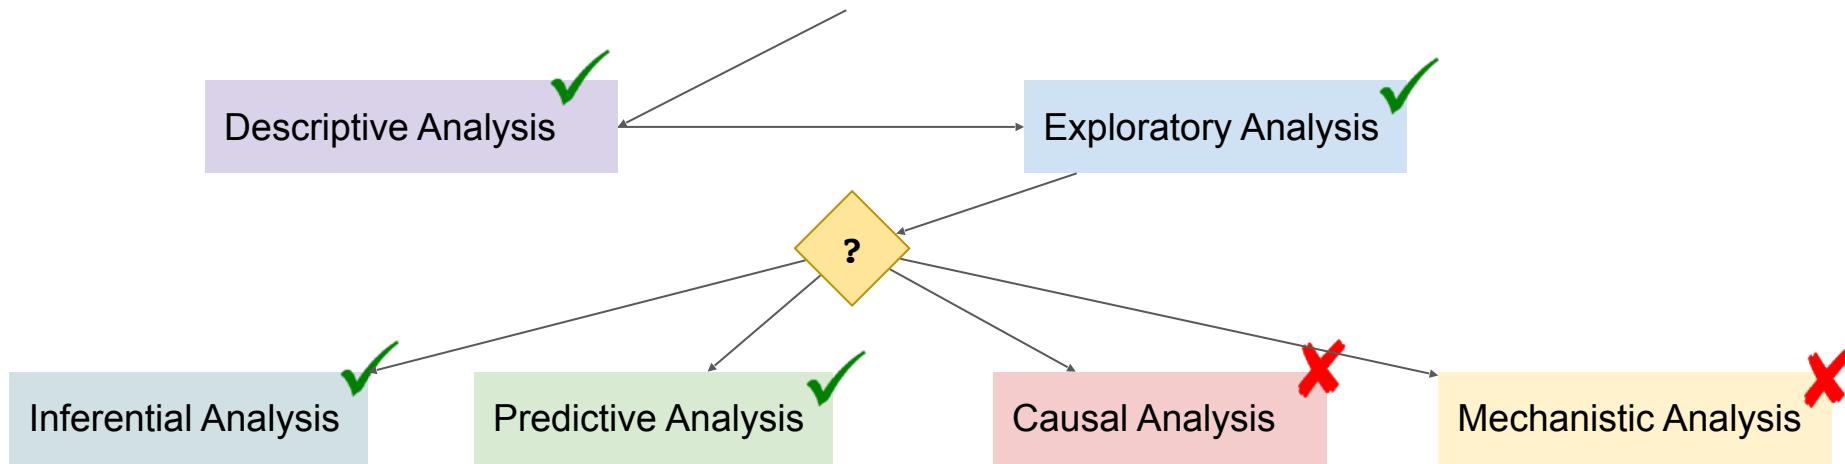

Data

The Analytic Approach Your Tool Box

The Goods

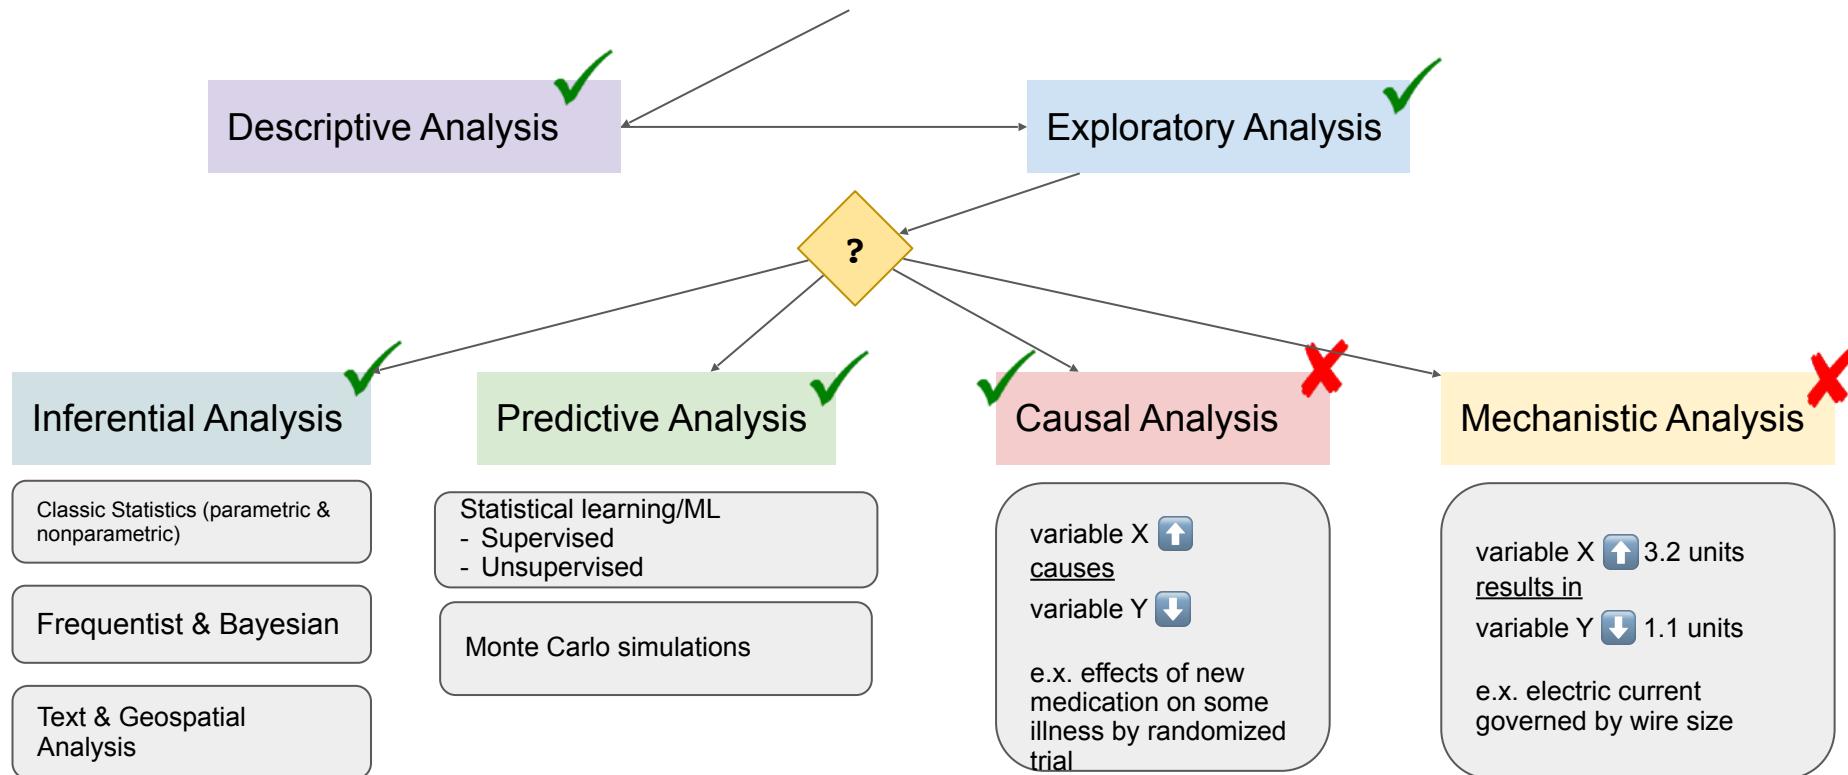

Data

The Analytic Approach Your Tool Box

The Goods

Summary: Analytical Approaches

Typically Less Effort

Descriptive Analysis

- 1st thing you do on new data
- Summarize the data
- univariate plots of variables

Exploratory Analysis

- Exploring relationships
- Asking/defining questions
- univariate/bivariate/multivariate analysis and plotting
- formulate hypothesis

Inferential Analysis

- Estimating uncertainty
- test theories (infer) about the population (data gen. process)
- Building inference models

Typically More Effort

Predictive Analysis

- Building predictive models
- Use historical knowledge to predict future events
- Finding patterns

Mechanistic Analysis

- Understand precise changes one variable has on another
- typically modeled using deterministic equations
- break down complex systems into constituent parts

Causal Analysis

- Determine the average change in one variable when you alter another
- typically requires experiments (e.g. randomized studies)
- manipulate one variable observe effect on other

Exploring Analyses

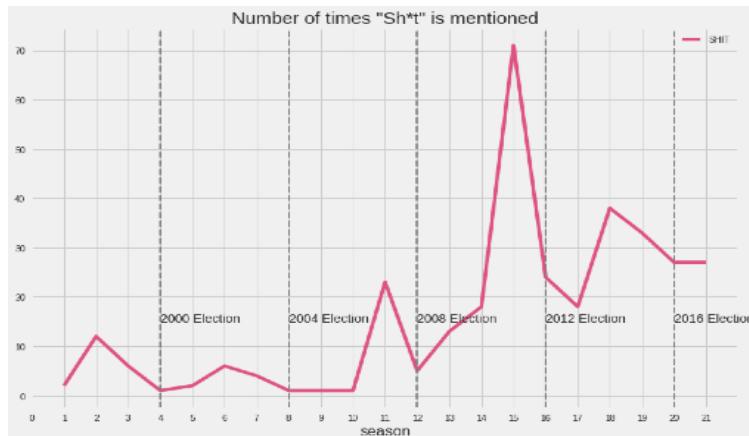

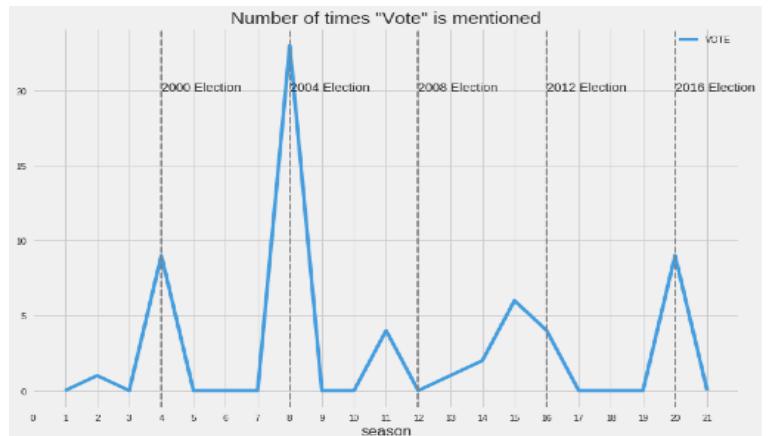

General question: What impacts politics in America?

Data Science question: Is there a relationship between the sentiment of political words in South Park and America's presidential approval rating?

Descriptive

Exploratory

Inferential

Text Analysis

Classic Statistics
(parametric & nonparametric)

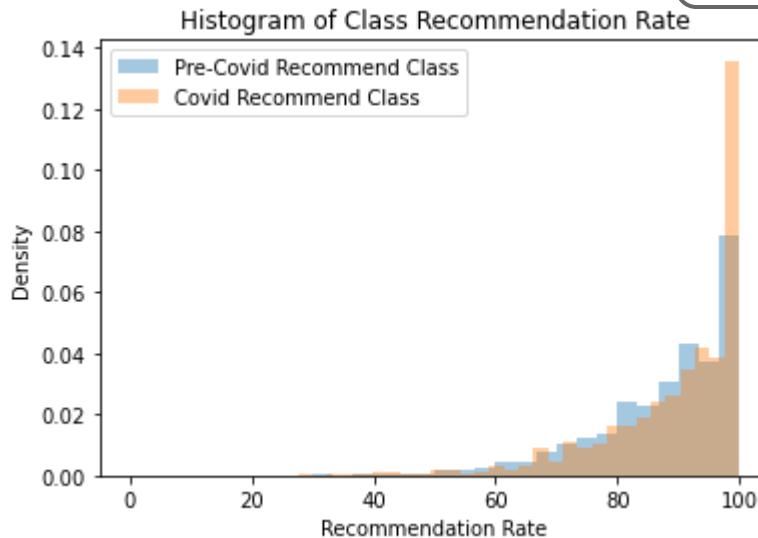

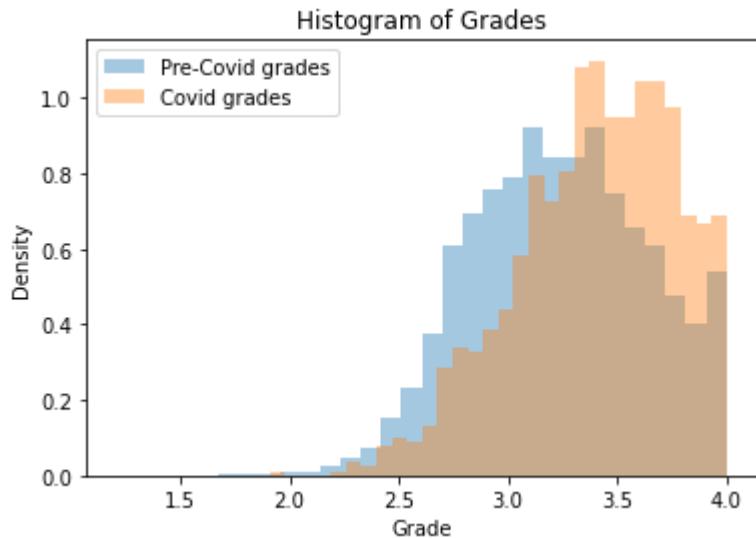

Descriptive

Exploratory

Inferential

General question: How has COVID-19 impacted students?

Data Science question: At UCSD, is there a difference between students' grades and how they rate their classes before COVID-19 and during remote learning, due to COVID-19?

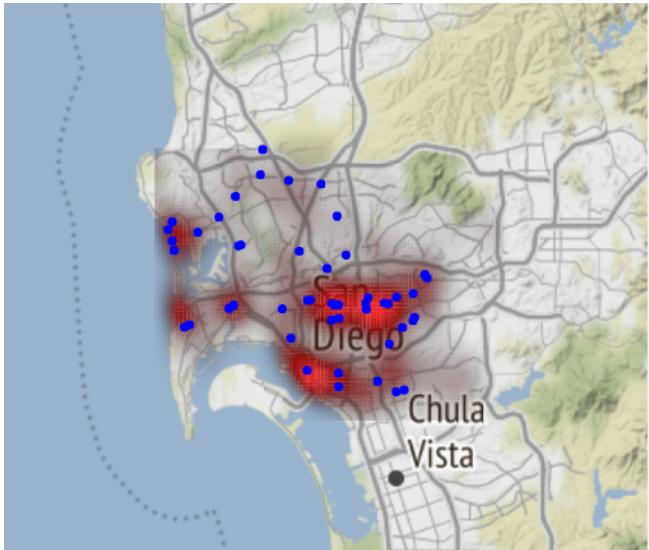

Classic Statistics
(parametric &
nonparametric)

General question: Why isn't police response time always the same?

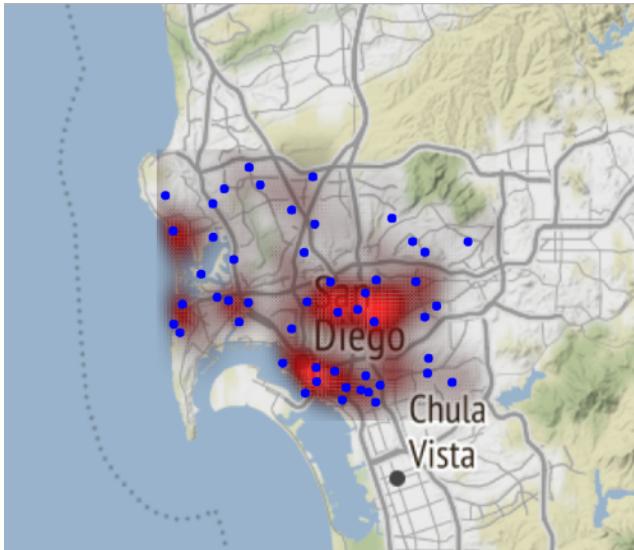

Descriptive

Data Science question: Where should police cars be stationed, accounting for crime levels and time of day, to make police response times equitable throughout San Diego?

Exploratory

Predictive

Inferential

Geospatial Analysis

General question: What gets too much attention in the news?

Descriptive

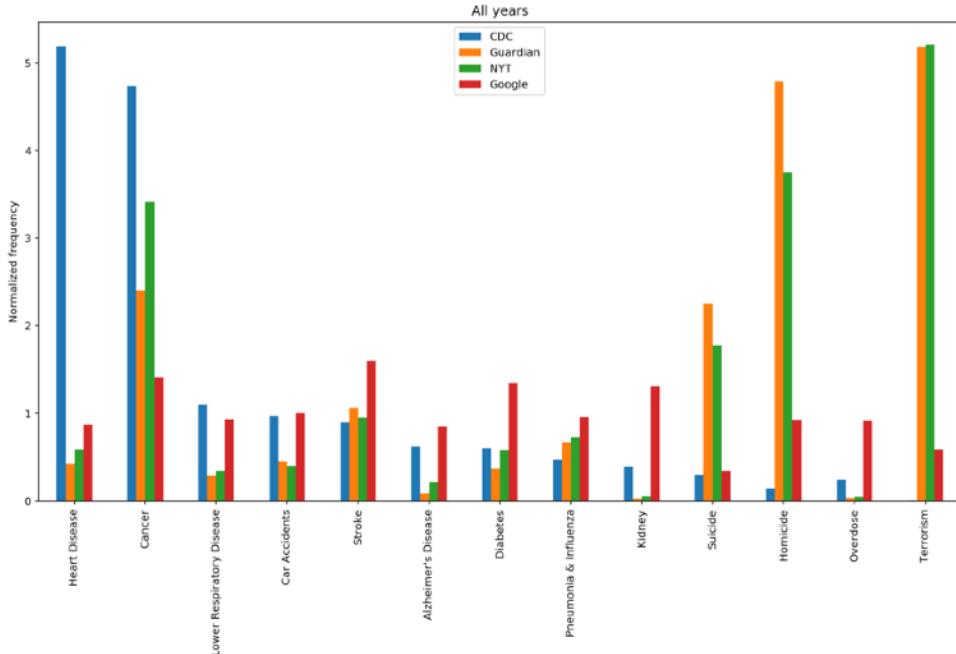

Data Science Question: Is there a relationship over time between cause of death terms in the *NYT*, The Guardian, and Google trends data relative to data from the CDC?

Exploratory

Inferential

Text Analysis

Classic Statistics
(parametric & nonparametric)

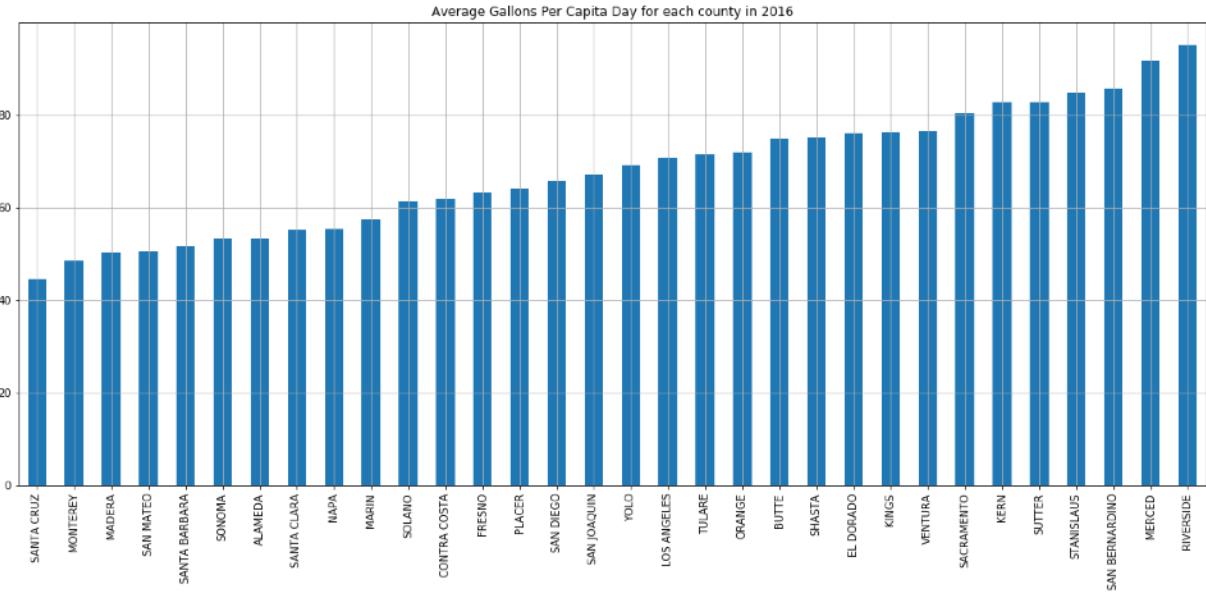

In case of the total drought in California, how many desalination plant projects we need to supply residential use water for population who live in urban areas in California?

Descriptive

Exploratory

Predictive

Descriptive and Exploratory Analysis

Descriptive

Descriptive: The goal of descriptive analysis is to understand the components of a data set, describe what they are, and explain that description to others who might want to understand the data.

- Problem: Understanding whether users are nice or mean on YouTube
- Data science question: Are the words that people use in their comments more frequently positive words (great, awesome, nice, useful) or negative words (bad, stupid, lame, awful)?
- Type of analysis: Descriptive analysis

To answer this you would calculate statistics about YouTube comments

Statistics

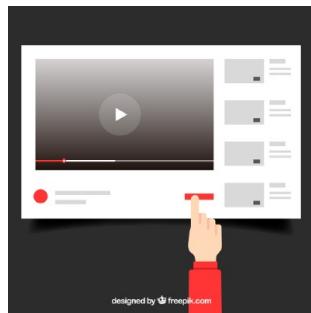

*“the science that deals with the **collection, classification, analysis, and interpretation of numerical facts or data**”*

A statistic:

“A quantity computed from a sample”

statistic

“A quantity computed from a sample”

For our YouTube analysis, we could take a random sample of comments from YouTube and calculate the following statistic: *the number of positive and the number of negative words in each review.*

Population

All comments on YouTube

During the second quarter of 2020, almost 2.13 billion comments on YouTube videos were removed due to violation of the platform's community guidelines. - J Clement on stata.com

We want to learn something about this...

Sampling

Inference

....but we can only *actually* collect data from this

1 million
comments from 2020

Sample

Best sampling practices:

- Always think about what your population is
- Collect data from a sample that is representative of your population
- If you have no choice but to work with a dataset that is not collected randomly and is biased, be careful not to generalize your results to the entire population

You'd want to be sure you sample randomly across *all* YouTube comments, making sure not to get more comments from one genre over another, or one location over another, etc.

Examples of bad sampling:

- Surveying subscribers of a gun-related magazine for research on Americans' attitudes toward owning guns
- Randomly sampling Facebook users for what TV shows people like

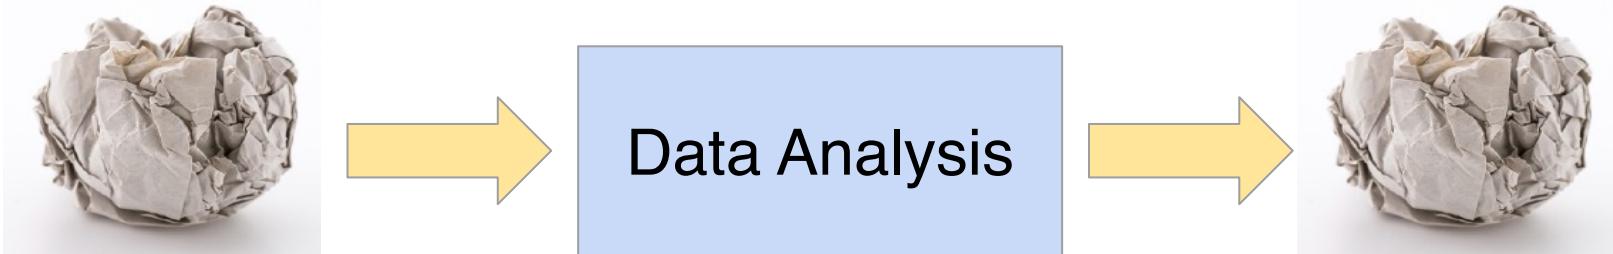

To understand *all* YouTube comments, you wouldn't just want to sample from one YouTube channel, or videos in a single language.

It's *always* worth spending time at the beginning of a project to determine whether or not the data you have are garbage.

Be certain they are actually able to help you answer the question you're interested in.

GIGO : Garbage In. Garbage Out.

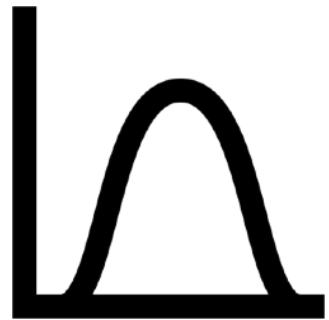

<https://forms.gle/v9bn5kCUVLW5Robc6>

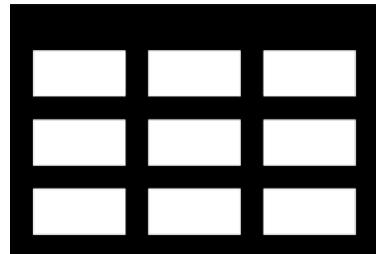

For the survey data I collected from you all, which of the following best describes the population I could generalize findings back to.

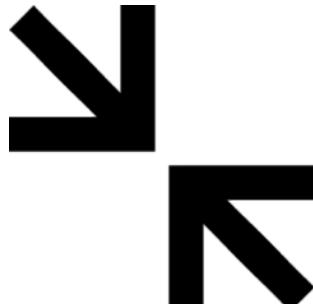

Descriptive Analysis

Shape

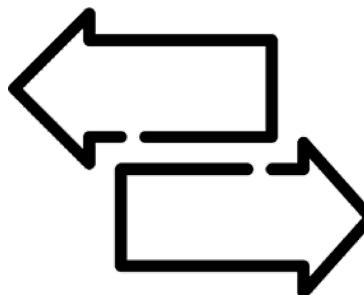

Size

Central
Tendency

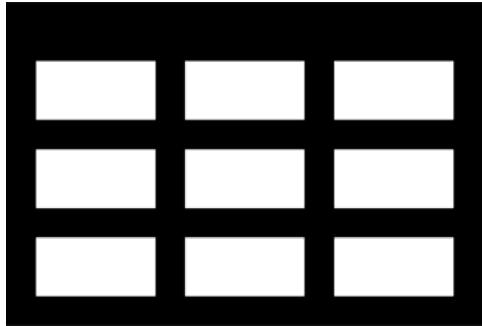

Missingness

Variability

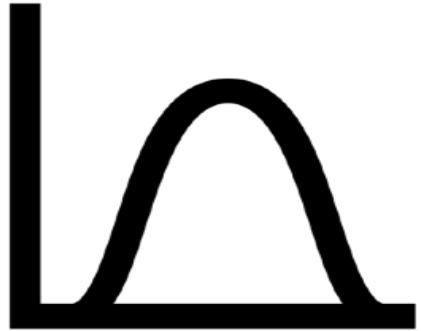

Descriptive

Size

How many observations (rows) and variables (columns) you have is an important first step. You should always be aware of the **size** of your dataset

Missingness It's critical to know how many observations have missing data for variables of interest in your data. Knowing *why* their missing is also important.

Shape

It's critical to know the distribution of the variables in your dataset. Certain statistical approaches can only be used with certain distributions.

Central Tendency

Knowing the mean, median, and/or mode can help you get an idea of what a typical value is for your variable(s) of interest

Variability

The central tendency tells you part of the story. The variability in the values in your observation helps fill in the rest.

Which of the following is NOT something accomplished by a descriptive analysis?

- A** Describes typical values in your dataset
- B** Determines the size of your dataset
- C** Establishes causal relationships between variables
- D** Identifies missing data
- E** Determines how variable values in your dataset are

Descriptive Analyses are often included as “Table 1” in academic publications

Descriptive

Table 1. Baseline Characteristics of the Patients.^a

Characteristic	Ranibizumab Monthly (N = 301)	Bevacizumab Monthly (N = 286)	Ranibizumab as Needed (N = 298)	Bevacizumab as Needed (N = 300)
Age — no. (%)				
50–59 yr	2 (0.7)	1 (0.3)	6 (2.0)	2 (0.7)
60–69 yr	33 (11.0)	28 (9.8)	31 (10.4)	34 (11.3)
70–79 yr	102 (33.9)	84 (29.4)	115 (38.6)	103 (34.3)

Descriptive Statistics & Summary

“We must suppress some of the truth to communicate the truth... In short, the techniques of descriptive statistics are designed to match the salient features of the data set to human cognitive abilities.”

-I.J. Good (1983)

Descriptive

Descriptive Statistics & Summary

Calculating descriptive statistics, understanding what they tell you about your data, and reporting them are critical steps in every analysis.

Yes statistics are summaries that throw away important detail, but human minds need the high level overview since we often struggle with the details.

Exploratory

Exploratory: The goal is to find unknown relationships between the variables you have measured in your data set. Exploratory analysis is open ended and designed to verify expected or find unexpected relationships between measurements.

Exploratory

Exploratory Data Analysis (EDA)
detective work answering the question:
“What can the data tell us?”

Why EDA?

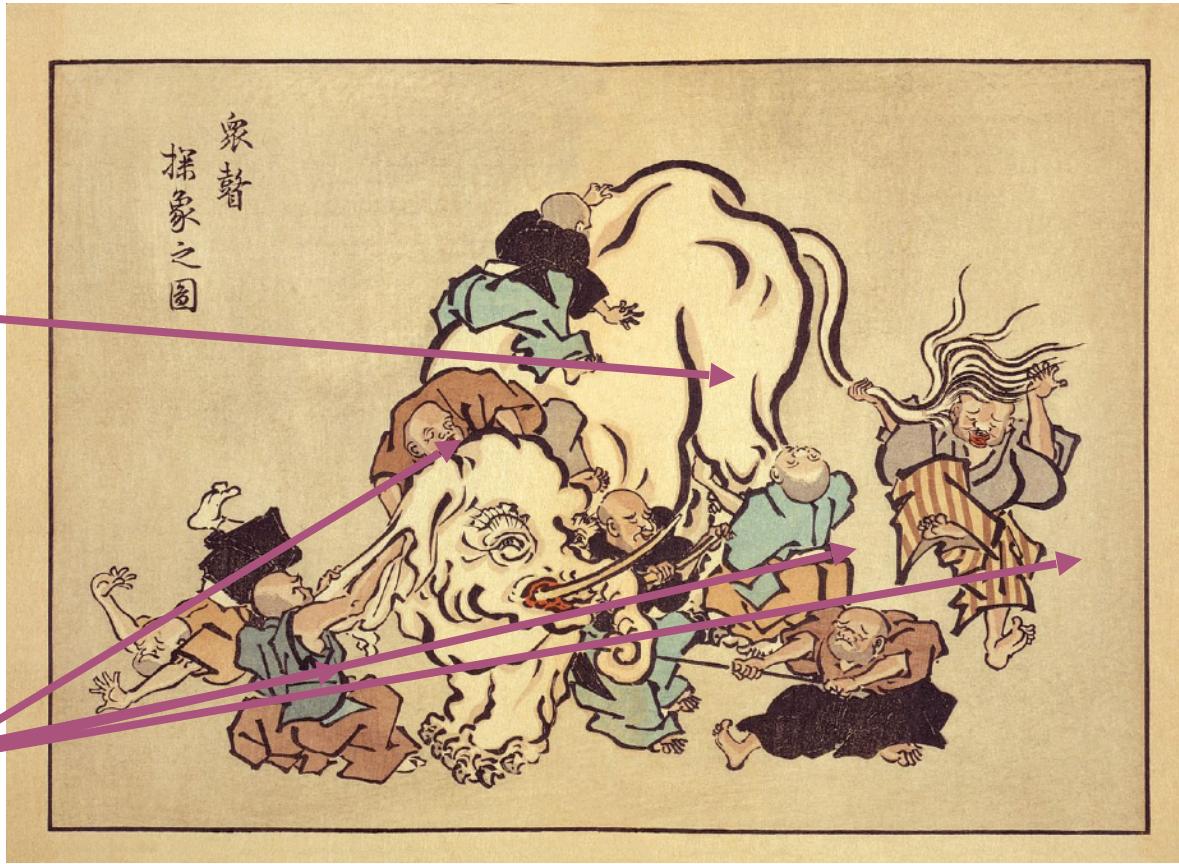

- Understand data properties
- Discover Patterns
- Generate & Frame Hypothesis
- Suggest modeling strategies
- Check assumptions (sanity checks)
- Communicate results (present the data)

.....and if you don't, you'll regret it

Exploratory

The
dataset

You

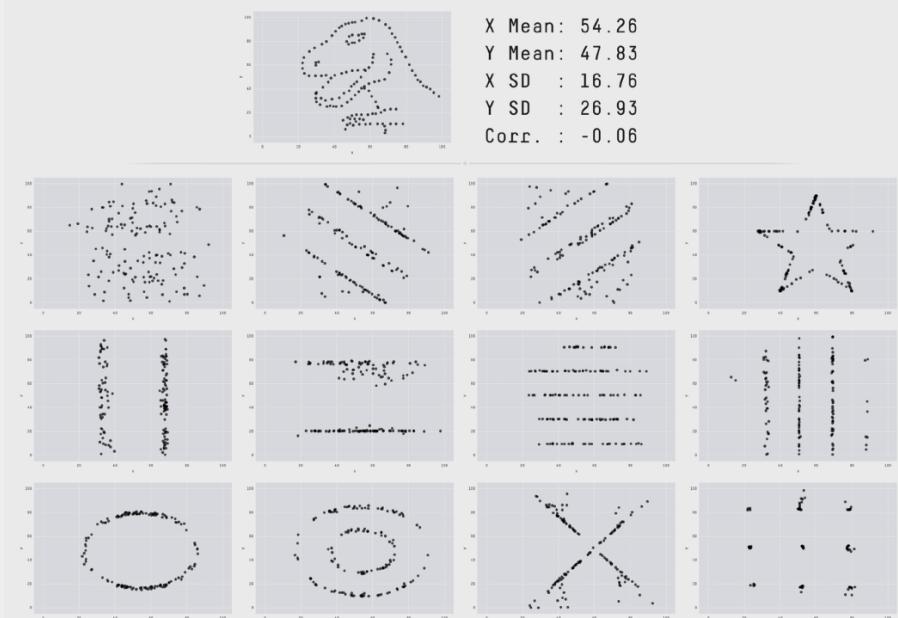

Exploratory

The general principles of exploratory analysis:

- Look for missing values
- Look for outlier values
- Calculate numerical summaries
- Generate plots to explore relationships
- Use tables to explore relationships
- If necessary, transform variables

Start raw

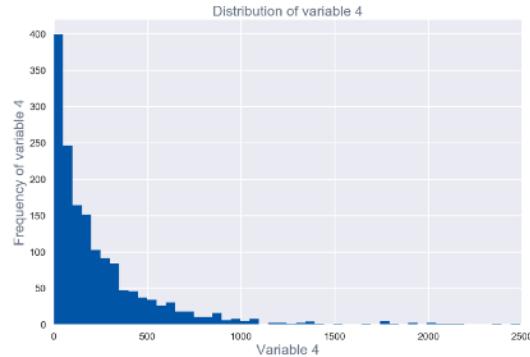

- Examine raw data in the most direct way you can reasonably do so
- View a random sample of the data
- Plots, especially subsets of variables and dimensionality reduction
- Helpful for seeing weirdness, missingness, outliers, min/max/typical values

Exploratory

EDA Approaches to “Get a Feel for the Data”

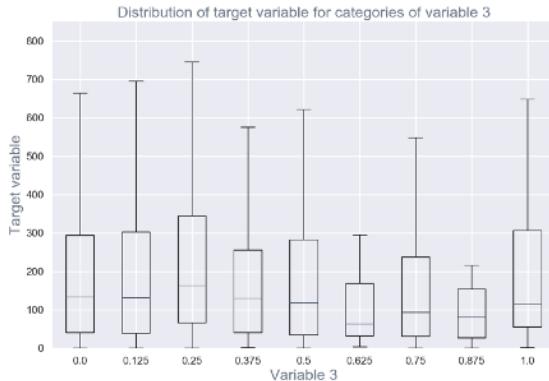

Understanding the relationship between variables in your dataset

Univariate

understanding a single variable

i.e.: histogram, densityplot, barplot

Bivariate

understanding relationship between 2 variables

i.e.: boxplot, scatterplot, grouped barplot, boxplot

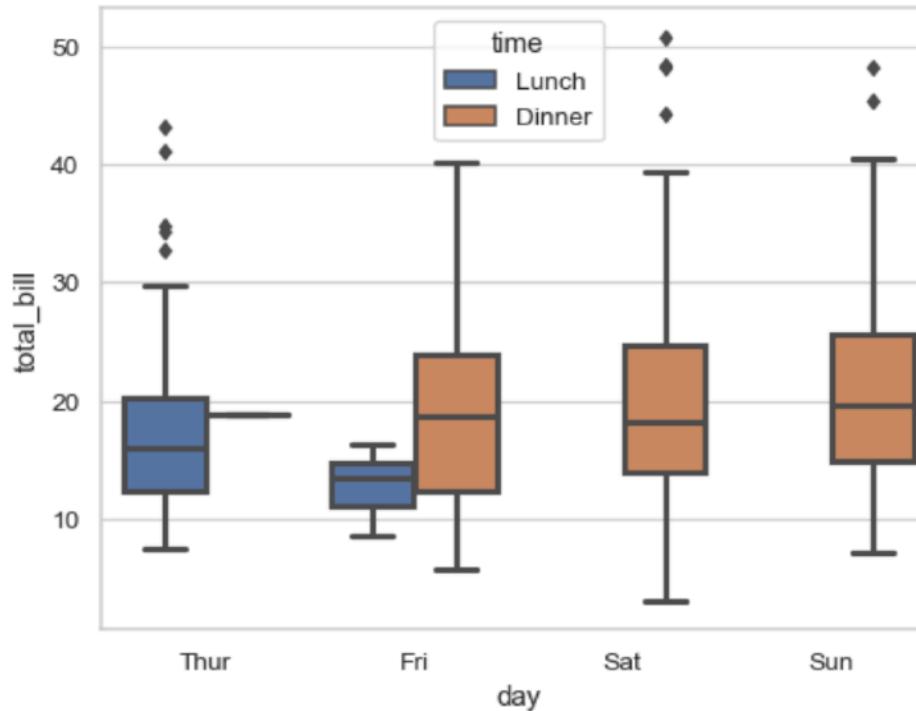

Dimensionality Reduction

projecting high-D data into a lower-D space

i.e.: PCA, ICA, Clustering

```
>>> ax = sns.boxplot(x="day", y="total_bill", hue="time",
...                     data=tips, linewidth=2.5)
```

```
sns.pairplot(penguins, hue="species")
```
